Data Diagram

Group 8

Task 2

"Create one or more data diagrams that represent the system your team is designing. Using the formalisms seen in the examples we have seen in class (check Canvas for slides) indicate details such as element names, relationships among data elements (for example, each element classA corresponds to exactly one element of classB, each element of classB corresponds to one or more elements of classA, etc.). Your data diagrams DO NOT need to include the operations that need to be performed on them. They only need to include attributes/fields."
